

Dejero

256-bit AES Encryption

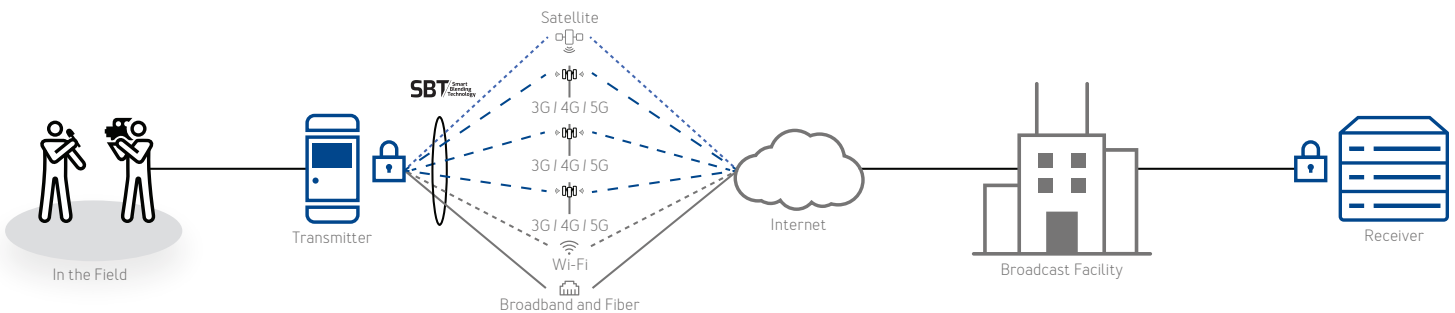

For Broadcast and Media

AES/256 ENCRYPTION

Don't stress about security risks when transporting content over public internet links. AES256 encryption, the strongest and most robust commercially-available standard, adds another layer of fool-proof security to protect your valuable content from being stolen, misused, or interfered with as it is transported from the field.

What it Does

Encrypts live video transmissions from the field. It also encrypts voice communications via IFB and Intercom.

What it Delivers

Your Content is Protected

Live video is safe while being transmitted from the field to a Dejero receiver.

Stress-Free Even Over Single Ethernet Link

Protected even when transporting via a single public internet link.

Trusted Standard in Internet Encryption

AES256 is the gold standard in encrypting data against compromise.

AES256 offers a key length of 2^{256} possible combinations. It would take billions of years to break AES256 using current computer technology through brute force.

Supported Devices

Transmitters	EnGo 1.3, EnGo 260
Encoders	PathWay E and EC
Receivers	WayPoint 50, WayPoint 104, WayPoint 204
Transceivers	FlexPoint 111

System Requirements

Core 5.4 Software	Contact Dejero Support to schedule an update
